TEKS RECOUNT

During the process of creating my personal portfolio website, I learned many new things about website design and development. I started by defining the design concept, choosing appropriate colors, and arranging the layout to ensure the website's appearance was attractive and comfortable to look at. Furthermore, I also learned to use HTML and CSS to make the website look neater, more responsive, and more modern.

During the process, I encountered several issues, such as images not displaying properly, elements sizing incorrectly, and text placement that weren't clear. However, these issues taught me to be more thorough in my coding and understand the function of each CSS property. I also explored various design references to make the website look more professional and less boring.

Through creating this website, I have gained a deeper understanding of the importance of creativity, precision, and consistency in creating a digital display. This experience has helped me improve my web design skills and boosted my confidence to continue learning and developing my skills in the technology world.
